

# AP CS Unit 6: Inheritance Exercises

depends on use of classes.

1. Suppose your program contains two classes: a Student class and a Female class. Which of the following is true?

- a) Making the Student class a subclass of the Female class is a good design decision.
- b) Making the Female class a subclass of the Student class is a good design decision.
- c) Either class could be a subclass of the other class; it would still be a good design decision.
- d) The only good design decision would be to make neither a subclass of the other.

2. Suppose your program contains two classes: a Rectangle class and a Square class. Which of the following is true?

bc a square is a specialized rectangle.

- a) Making the Rectangle class a subclass of the Square class is a good design decision.
- b) Making the Square class a subclass of the Rectangle class is a good design decision.
- c) Either class could be a subclass of the other class; it would still be a good design decision.
- d) The only good design decision would be to make neither a subclass of the other.

3. Suppose your program contains two classes: a Computer class and a Monitor class. Which of the following is true?

- a) Making the Computer class a subclass of the Monitor class is a good design decision.
- b) Making the Monitor class a subclass of the Computer class is a good design decision.
- c) Either class could be a subclass of the other class; it would still be a good design decision.
- d) The only good design decision would be to make neither a subclass of the other.

a computer 'has-a' monitor

Use the java api 7 to answer questions 4 to 7.

4. What is the superclass of the Math class? Object class

5. The JButton class is the subclass of the AbstractButton class which is the subclass of the JComponent class which is the subclass of the Container class which is the subclass of the Component which is the subclass of the Object class. (Be sure to look at how many methods JButton inherits.)

<p>6. What is the data type of the variable <i>out</i>? <u>PrintStream</u></p> <p>Go to that class and look up the print method. The print method is overloaded. How many different print methods are there? <u>9</u></p>	<pre>Cow c = new Cow(); System.out.print( c );</pre>
<p>7. Select the TRUE statement(s).</p> <ul style="list-style-type: none"> <li>a) The print method displays the contents of <i>c</i> which is a reference to a Cow object.</li> <li><input checked="" type="radio"/> b) If the argument to the print method is an object, the object's toString method will be called and the string it returns will be displayed. (if no toString method, then uses object's toString)</li> <li>c) If the Cow class did not contain a toString method then the code will either not compile or it will crash at run-time.</li> </ul>	

pg 1-2 notes

<pre>public class Animal{     public void m1(){         System.out.print("A");     }     public void m2(){         System.out.print("B");     } }</pre>	<pre>public class Dog extends Animal{     public void m1(){         System.out.print("C");     }     public void m3(){         System.out.print("D");     } }</pre>
---	---

Problems 8 to 13 refer to the above classes. If it does not compile, write **COMPILER ERROR**.

8. What is displayed? <span style="margin-left: 20px;">C</span>	Dog d = new Dog(); d.m1();
9. What is displayed? <span style="margin-left: 20px;">B</span>	Dog d = new Dog(); d.m2();
10. What is displayed? <span style="margin-left: 20px;">D</span>	Dog d = new Dog(); d.m3();
11. What is displayed? <span style="margin-left: 20px;">COMPILER ERROR</span>	Animal a = new Animal(); a.m3();
12. Does this compile and will it run? <span style="margin-left: 20px; font-size: small;">Yes it will contain @Dog</span>	Dog x = new Dog(); String s = x.toString();
13. The m1 method in the Dog class overrides the m1 method in the Animal class. <span style="margin-left: 20px; font-size: small;">Same heading exactly</span>	<div style="border: 1px solid black; border-radius: 50%; width: 40px; height: 20px; display: inline-block; margin-right: 10px; text-align: center; line-height: 20px;">TRUE</div> FALSE

<pre>public class Vehicle{     public void v(){         SOP("V");     }     public void e(){         SOP("E");     } }</pre>	<pre>public class Plane extends Vehicle{     public void p(){         SOP("P");     }     public void v(){         super.v();         SOP("X");     } }</pre>	<pre>public class Jet extends Plane{     public void j(){         SOP("J");     }     public void e(){         SOP("A");         super.e();     } }</pre>
--	---	---

Note. Of course SOP is not valid code. I'm using an abbreviation to save space.

Problems 14 to 20 refer to the above classes. If it does not compile, write **COMPILER ERROR**.

14. What is displayed? <span style="margin-left: 20px;">COMPILER ERROR</span>	Vehicle k = new Vehicle(); k.p();
15. What is displayed? <span style="margin-left: 20px;">V</span> <span style="margin-left: 20px;">X</span>	Plane k = new Plane(); k.v();
16. What is displayed? <span style="margin-left: 20px;">E</span>	Plane k = new Plane(); k.e();
17. What is displayed? <span style="margin-left: 20px;">A</span> <span style="margin-left: 20px;">E</span>	Jet k = new Jet(); k.e(); <span style="font-size: small;">A - no e in super gives to grand parent</span>
18. What is displayed? <span style="margin-left: 20px;">V</span> <span style="margin-left: 20px;">X</span>	Jet k = new Jet(); k.v();
19. Does this compile and will it run?	Jet z = new Jet(); boolean b = z.equals( "?" );
20. Ignoring methods inherited from the Object class, what methods could be called in the second line? <span style="margin-left: 20px; font-size: small;">e, j, p</span>	Jet z = new Jet(); z.

test

V

easy to forget implicit supercall

<pre>public class Toy{     public Toy(){         System.out.print("T");     }     public Toy( String s ){         System.out.print( s );     } }</pre>	<pre>public class YoYo extends Toy{     public YoYo(){         super("A");         System.out.print("Y");     }     public YoYo(String s){         super()         System.out.print(s);     } }</pre>
--	---

Problems 21 to 24 refer to the above classes. These all compile and run.

21. What is displayed?	AY	YoYo y = new YoYo();
22. What is displayed?	TW	YoYo y = new YoYo( "W" );
23. The constructors in the Toy class are overloaded.	<input checked="" type="radio"/> TRUE	<input type="radio"/> FALSE
24. The second constructor in the YoYo class overrides the second constructor in the Toy class.	<input type="radio"/> TRUE	<input checked="" type="radio"/> FALSE

```
public class Tool{
    private int x;

    public Tool(int n){
        x = n;
    }
    public int get(){
        return x;
    }
}
```

★ constructors are not overridden ★

Problems 25 to 27 refer to the above class.

25. There is a compiler error in this constructor. Fix it. And don't touch the Tool class; that's perfect. Fix the Hammer class's constructor.	<pre>public class Hammer extends Tool{     private int y;      public Hammer(){         y = 7;     } }</pre>
26. Select the TRUE statement. a) The Axe class compiles. b) Line 1 causes a compiler error; line 2 is fine. c) Line 2 causes a compiler error; line 1 is fine. d) Lines 1 and 2 both cause compiler errors.	<pre>public class Axe extends Tool{     public Axe(){         1 super( 4 );         2 x = 8;     } }</pre>
27. The Saw class compiles.  What is the value of n?	<pre>// client code Saw jig = new Saw( 3, 8 ); int n = jig.get();</pre>
3	<pre>public class Saw extends Tool{     private int x;      public Saw( int a, int b ){         super( a );         x = b;     } }</pre>

there is an implicit call to super() as a no-args, need a one-arg constructor?

add super();

get method in tool class is called since Saw class doesn't have one.

<p>28. Only one of the two ShoeBox constructors compile. Which one does NOT compile and why?</p> <p>one-arg version does not compile. child class <u>cannot</u> access parent class</p>	<pre>public class Box {     private int x;      public void set(int n){         x = n;     } }</pre>	<pre>public class ShoeBox extends Box{     private int z;      public ShoeBox (int h) {         z = h;         x = h;     }      public ShoeBox () {         z = 8;         set( 8 );     } }</pre> <p>not allowed private inst var in Box class</p>
---	--	--

private instance vars.

<pre>public class Plant {     public void m1(){         SOP("P1");     }     public void m2(){         SOP("P2");         m1();     }     public void m8(){         SOP("P8");     } }</pre>	<pre>public class Tree extends Plant{     public void m1(){         SOP("T1");     }     public void m3(){         m1();         SOP("T3");     }     public void m8(){         super.m8();         SOP("T8");     } }</pre>	<pre>public class Elm extends Tree{     public void m1(){         SOP("E1");     }     public void m4(){         SOP("E4");     }     public void m8(){         SOP("E8");         super.m8();     } }</pre>
--	--	--

SOP is an abbreviation for System.out.print.

Problems 29 to 35 refer to the above classes

<p>29. What is displayed? P2 P1</p>	<pre>Plant p = new Plant(); p.m2();</pre>
<p>30. What is displayed? T1 T3</p>	<pre>Tree t = new Tree(); t.m3();</pre>
<p>31. Will this compile and run? If yes, what is displayed? (There is a lot to be learned by this problem.) P2 ← no m2 method in tree so parents used T1 ← when m1 call made JVM knows to call tree's m1 method! Late binding</p>	<pre>Tree t = new Tree(); t.m2();</pre>
<p>32. Will this compile and run? If yes, what is displayed? E1 m3 runs in Tree class but JVM knows to use Elm's m1 method T3</p>	<pre>Elm e = new Elm(); e.m3();</pre>
<p>33. Will this compile and run? If yes, what is displayed? P2 E1</p>	<pre>Elm e = new Elm(); e.m2();</pre>
<p>34. What is displayed? P8 T8</p>	<pre>Tree t = new Tree(); t.m8();</pre>
<p>35. What is displayed? E8 P8 T8</p>	<pre>Elm e = new Elm(); e.m8();</pre>

Good one!

<p>36. This code generates the following compiler error:          toString() in Moe cannot override toString() in java.lang.Object; attempting to use incompatible return type</p> <p>Explain what this means. <i>to override the header must be exactly the same.</i></p> <p><i>public String toString()</i></p>	<pre>public class Moe {     public void toString() {         // code     } }</pre>
---	--

<p>37. This class compiles but its equals method does not override the equals method in the Object class. Explain why it doesn't.</p> <p><i>parameter type must match</i></p> <p><i>public boolean equals(Object o)</i></p>	<pre>public class AA {     public boolean equals( int n ){         return true;     } }</pre>
---	---

<p>38. This does compile and run. It displays ...</p> <p>a) true          b) false</p>	<pre>String s = "??"; System.out.println( s instanceof Object );</pre>
--	--

<p>39. Why does the first line compile?</p> <p><i>bc. String 'is-a' object</i></p> <p>40. What is displayed?</p> <p><i>true</i>  <i>False</i>  <i>False</i> } <i>late binding knows x is "truly" a String</i></p>	<pre>Object x = "??"; System.out.println( x instanceof String ); System.out.println( x instanceof Integer ); System.out.println( x instanceof Math );</pre>
---	---

<p>41. Name two reasons why the second line does not compile.</p> <p><i>instanceof works only on object types. to be an 'instance' implies object construction</i></p>	<pre>int z = 13; System.out.println( z instanceof int );</pre>
--	--

<p>42. Why is it ok to pass a String or Integer object to a method that has a parameter of type Object?</p> <p><i>bc string and Integer are both children of Object.</i></p> <p>43. Circle the one line that causes the following run-time error: ClassCastException</p> <p><i>"hi" can not be Integer type</i></p> <p>44. Could the body of method2 be replaced with this one line:          String e = c.toString();          and still produce the same results?</p> <p><i>yes bc .c is "truly" a String and so the String class's toString is called.</i></p>	<pre>public class Runner {     public static void main(String[] args) {         method1( "hi" );         Integer h = new Integer( 15 );         method2( h );     }     public static void method1(Object a){         Integer b = (Integer) a;     }     public static void method2(Object c){         Integer d = (Integer) c;         String e = d.toString();     } }</pre>
---	--

<pre>public class Clock{     private int x;      public Clock(int n){         x = n;     }      public boolean equals(Object x){         if (x instanceof Clock) {             Clock c = (Clock)x;             return this.x == c.x;         }else             return false;         }     } }</pre>	<pre>public class Cuckoo extends Clock{     private int y;      public Cuckoo(int a, int b){         super(a);         y = b;     }      public boolean equals(Object x){         if (!(x instanceof Cuckoo) )             return false;          Cuckoo c = (Cuckoo)x;         if ( super.equals(c) &amp;&amp; y == c.y )             return true;         else             return false;     } }</pre>
--	--

<p>45. What is displayed?</p> <p style="margin-left: 40px;">true false true</p>	<pre>Clock c1 = new Clock( 12 ); Cuckoo c2 = new Cuckoo( 12, 9 ); Cuckoo c3 = new Cuckoo( 12, 9 ); System.out.println( c1.equals( c2 ) ); System.out.println( c2.equals( c1 ) ); System.out.println( c3.equals( c2 ) );</pre>
---	---

Note. There general guidelines for writing the equals method. One rule is that if A equals B then B should equal A. I broke this rule for the purposes of keeping the code simple.

<pre>public class Person{     private String name;      public Person( String s ){         name = s;     }      public String toString(){         return name;     } }</pre>	<pre>public class Student extends Person {     private int grade;      public Student( int g, String s ){         super( s );         grade = g;     }      public String toString(){         String x = super.toString();         return x + " grade " + grade;     } }</pre>
--	--

<p>46. What is displayed?</p> <p style="margin-left: 40px;">Miller Friend grade 12 Chheu grade 10 Liu</p>	<pre>Person [] p = new Person[ 4 ]; p[0] = new Person( "Miller" ); p[1] = new Student( 12, "Friend" ); p[2] = new Student( 10, "Chheu" ); p[3] = new Person( "Liu" );  for ( int k = 0; k &lt; p.length; k++ )     System.out.println( p[k] );</pre>
---	--

<pre>public class TryIt {     public static void main(String [] args) {         ABC bob = new ABC();         XYZ jill = new XYZ();          System.out.println(bob.methodD(10));         System.out.println(bob.methodE(20.0) );         System.out.println(jill.methodD(30) );         System.out.println(jill.methodE(40) );         System.out.println(jill.methodE(50.0) );     } }</pre>	<pre>public class ABC {     public int methodD(int x) {         return 2*x;     }      public double methodE(double x) {         return 3*x;     } }  // another file public class XYZ extends ABC {     public int methodD(int x) {         int y = super.methodD(x);         return 5*y;     }      public double methodE(int x) {         double y = methodE(0.5*x);         return 7*y;     } }</pre>
---	---

*goes straight to ABC class double methodE*

*double forces this call*

47) What is displayed when the above main method is executed?

20
60.0
300
420.0
150.00

48) What does the client code display? If there is a compiler or run-time error, write ERROR. Pretend that earlier errors do not effect later statements.

<pre>// client code BB x = new BB(); x.m1(); x.m2(); x.m3();  AA y = new BB(); y.m1(); y.m2(); y.m3();</pre>	<pre>public class AA {     public void m1() {         System.out.print("A1");         m2();     }      public void m2() {         System.out.print("A2");     } }</pre>	<pre>public class BB extends AA {     public void m2() {         System.out.print("B2");     }      public void m3() {         System.out.print("B3");     } }</pre>
--	---	--

*as AA class has no m3 method*

*for compile check*

49. This does compile and run. Select the TRUE statement. a) It calls the equals method defined in the Object class. b) It calls the equals method defined in the String class.	Object x = "cold"; Object y = "hot"; System.out.println(x.equals(y));
---	---

50. This compiles and runs. What is displayed?  <i>Cat book book dog</i>	// client code Object [] a = new Object[5]; a[0] = "cat"; a[1] = new Book(); a[2] = new Book(); a[3] = "dog";  for ( int i = 0; i < 5; i++) System.out.println( a[i] );	public class Book { public String toString(){ return "book"; } }
--	---	--

public class Planet{ public int get(){ return 4; } }	public class Earth extends Planet { public int get(){ return 8; } }
51. What is x? <i>8</i>	Planet p = new Earth(); int x = p.get();

public class Kennel { public static void main(String[] args) { Dog emma = new Dog( 12 ); Dog king = new Dog( 12 ); System.out.println( emma == king ); System.out.println( emma.equals(king) ); } }	public class Dog { private int age = 0;  public Dog( int a ) { age = a; }  public boolean equals( Object obj ){ if ( !(obj instanceof Dog) ) return false;  if ( age == ((Dog) obj).age ) return true; else return false; }
52. The above runs and prints: <i>FALSE</i> <i>TRUE</i> <i>// not same object // not pointing to // same place in // memory</i>	

53. Assume this compiles and runs. Do the two methods behave exactly the same? a) Yes b) No	public void m1( Monster m ) { if (m instanceof Ghost ) { Ghost g = (Ghost) m; g.dance(); } else m.dance(); }	public void m1( Monster m ) { m.dance(); }
---	--	--

*except if right one holds in m a ghost object it might not compile, we don't have info on Ghost or in newer class.*

```
public class MyMain {
    public static void main( String [] args ) {
        XX x = new XX();
        x.methodA();
        x.methodB();

        System.out.println( "*****" );
        YY y = new YY();
        y.methodA();
        y.methodB();
    }
}
```

54. When the above main method is run, 11 lines are displayed. Fill in the 10 blanks. The second half is very tricky but it is one that you need to understand.

- \_\_\_\_\_ X
- \_\_\_\_\_ A
- \_\_\_\_\_ A
- \_\_\_\_\_ B
- \*\*\*\*\*
- \_\_\_\_\_ X
- \_\_\_\_\_ X
- \_\_\_\_\_ AX
- \_\_\_\_\_ AX
- \_\_\_\_\_ B
- \_\_\_\_\_ BX

*any method calls here check first for YY class methods*

```
public class XX {
    public XX() {
        System.out.println( "X" );
    }

    public void methodA() {
        System.out.println( "A" );
    }

    public void methodB() {
        methodA();
        System.out.println( "B" );
    }
}

// another file
public class YY extends XX{
    public YY() { super()
        System.out.println( "Y" );
    }

    public void methodA() {
        System.out.println( "AX" );
    }

    public void methodB() {
        super.methodB();
        System.out.println( "BX" );
    }
}
```

55. Will this method compile and run? If yes, describe what it does. If no, what is the problem?

*Counts only objects who are of type String*

```
public int county( Object[] list ){
    int n = 0;
    for ( int i = 0; i < list.length; i++ ){
        if ( list[i] instanceof String )
            n++;
    }
    return n;
}
```

56. Select the TRUE statement(s).

- a) Machine may be an abstract class.
- b) The Machine class must define or inherit a process method.
- c) The Robot class may or may not define a process method.
- d) Robot cannot be an abstract class.

```
// assume this compiles/runs
Machine x = new Robot();
x.process();
```

*to compile*  
*can inherit Machine's process*

*all*

<p>57. Will this method compile? If no, explain. <i>it does compile</i></p> <p>If it compiles, will it run error free? Explain. <i>it will run if the objects are all strings already.</i></p>	<pre>public int county( Object[] list ){     int n = 0;     for ( int i = 0; i &lt; list.length; i++){         String str = (String) list[i];         n += str.length();     }     return n; }</pre>
--	--

58. Select the FALSE statement.

- a) Every method in an abstract class is an abstract method.
- b) Every class inherits methods from the Object class.
- c) A private method in a superclass cannot be invoked by a subclass.
- d) A concrete class that extends an abstract class must override any abstract methods.

<pre>public class Runner{     public static void main(String [] args) {         Tuna tina = new Tuna();         Fish f = new Tuna();         System.out.println( tina.swim() );         System.out.println( tina.breathe() );         System.out.println( f.breathe() );         System.out.println( f.cook() );     } }</pre> <p>59. What is displayed when the above main method is executed? One of the statements generates a compiler error. Write ERROR for that line and pretend it doesn't affect the others.</p> <p><u>a</u></p> <p><u>bbb</u></p> <p><u>bbb // 'truly' a Tuna</u></p> <p><u>compile error, Fish class has no cook method</u></p>	<pre>public class Fish {     public String swim() {         return "a";     }      public String breathe() {         return "b";     } }  // another file public class Tuna extends Fish {     public String breathe() {         String s = "";         for ( int k=1; k&lt;=3; k++)             s += super.breathe();         return s;     }      public String cook() {         return "yum";     } }</pre>
--	--

<p>60. For this to compile, Lamp should be a subclass of Light and the Light class must define an on method.</p> <p>TRUE                      FALSE</p> <p>61. At runtime the JVM will take the reference in x and try to run the on method in the Lamp class. If Lamp does not define an on method then it will use the on method from the Light class.</p> <p>TRUE                      FALSE</p>	<pre>Light x = new Lamp(); x.on();</pre>
---	--

62. If this compiles then Monkey cannot be an abstract class.	TRUE FALSE	Monkey m = new Monkey();
63. If this compiles then Animal cannot be an abstract class.	TRUE FALSE	Animal a = new Bear();

64. Does this class compile?  YES	<pre>public abstract class Polygon {     private boolean convex;      public Polygon( boolean b ){         convex = b;     }      public abstract double getArea();      public boolean get(){         return convex;     } }</pre>
---	---

65. Write the Square class which is a non-abstract subclass of the Polygon class. The Square should have one instance variable, int side, which represents the length of one side. The Square constructor should have one parameter that is used to initialize the instance variable.

And yes, the above Polygon class does compile and so should your Square class.

```
public class Square extends Polygon {
    private int side;

    public Square (int s) {
        super(true); //all squares convex
        side = s;
    }

    public double getArea() {
        return side * side;
    }
}
```

66. How many Thing objects does this statement create?	Thing [] m = new Thing[20];
67. If this compiles then Thing cannot be an abstract class.	

None! space for 20 Thing objects  
TRUE FALSE

m array holds ptrs to Thing objects!
